Dear Deepak Ji,

First of all, thanks to your effort and for the quick update.

I have a few questions- of the 790 screened, 579 antigen tests were done--what did the rest of the people get? How were the 790 people identified (are they all of them who volunteered to get tested in the municipality? or some kind of clinical symptom checklist was used?

Where are the test positive patients isolated? Is there anyone monitoring their symptoms? If they get sick, how close is the nearest health facility?
